**August 12, 2024**  
**United Nations, Philippines**

# Overview

- OG-PHL Inputs
  - Parameters and larger objects
  - Where to find them
- OG-PHL Output
  - Where it is
  - How to access it
  - Different ways to display it
- Ways to run the model

## Takeaway

Basic understanding of model parameters, outputs, and how to run the model

# OG-PHL Inputs

## Two types of inputs

Parameters and arrays: Necessary info for model simulation

- New description of all parameters in OG-Core appendix chapter “[Model parameters](#)”
- New list of uniquely calibrated parameters in [OG-PHL documentation](#)
- Best description in OG-Core [default\\_parameters.json](#) file
- Other inputs, such as demographics, are created/updated with other files like [parameters.py](#) in OG-Core, and [calibrate.py](#) in OG-PHL

# Default parameters and parameters object

- Go through OG-Core `default_parameters.json` and “Model parameters” chapter
- Instantiate a default OG-Core parameters object in notebook
- Go through OG-PHL  
`ogphl_default_parameters.json`
- Update the parameters object in notebook to OG-PHL default
- Show how to update and change parameters in scripts

# OG-PHL output

Two main output files for each Simulation

- SS\_vars.pkl
- TPI\_vars.pkl

## Notebook

Go through output and image objects and show automatic functionality

# Ways to run OG-PHL

- ① (Local) Clone/download all repository files
  - Best for developing and customizing
  - Create `ogphl-dev` conda environment
  - Run either with Python scripts or in Jupyter notebook
- ② (Local) `pip install ogphl` from PyPI.org
  - Best if only want parameter changes, and don't need to change underlying model
  - Run either with Python scripts or in Jupyter notebook
- ③ (Cloud) Run in Google Colab using `pip install ogphl`
